Release Notes

mint.jar 1.06.00

(Released 17/09/2018)

PNG File Input Node

Created a new PNG File input node that adds a DICOM wrapper from a CSV file around a PNG image file.

De-anonymisation Node

Added a new node to restore the primary information to an anonymised instance using the anon and reUID database tables. Lower level reconciliation can then be added using the PJ version of the reconciliation node.

Reconciliation Node Extension

Added in an option to allow the reconciler to look for a series or study UID match in the database when no SOP Instance UID matches and use that for the reconciliation details. Only applies to PJ schema.

Request Type

Added request type to the response collector and corrected the tag that it looks in for the Source column in the order table.

Switch Node

Fixed a bug where the switch still passed through queries, even in the off position. The switch node needs to override the find and retrieve methods to send them to the devnull if the switch is off.
