## Release Notes

### **mint.jar 1.13.00**

(Released 28/02/2019)

#### **CMOVE Proxy Association**

Modified the proxy store node to use the association filter at the input node when accepting the proxied CMOVE result.

#### **Switch Node Bug**

Fixed a bug with the default setting for the switch being off, even though it should be on.

#### **File Import Looping**

Fixed a bug with the looping in continuous mode whereby the input node would finish if there were no images to process.

Fixed an issue with re-evaluating the number of workers in continuous mode in that, should the number of threads get reduced due to a limited number of roots, it would stay at the reduced level, even if more folders appeared.

#### **Semi-flat File System**

Added the option to put each image in its own folder when writing to a flat file system.

#### **DB Validator Fix Up Option**

Added the option to fix up the demographics with the database values in the event of a clash rather than just adding -N to the PID.
