

Release Notes

mint.jar 1.24.06

(Released 15/11/2022)

DB Node SSL

Added in SSL arguments to the DB URL for SQL Server.

Decompressor Node

Updated the decompressor node to not change the syntax in the header until after the pixel data is started to be read, otherwise it could make the DicomTagsAndValues class not call the process frame. The storeInit call is therefore put off until the just before output processframe is called for the first frame.

Notification Node

Removed HTML encodings like %20.

Added option to allow setting of the email body text.

Fixed a bug where the UID check for having already sent a notification for a study could fail.
