Release Notes

pjk.jar 1.06.00
(Released 17/09/2018)

DICOM UID
Moved the DICOM UID testing into the DicomDict class.

Splitter / Anonymiser Issue
Fixed an issue with the splitter when used with the anonymisation node in that the value for the last tag value wasn't copied in the copy process of the DicomTagsAndvalues. This meant that when anonymising using a splitter could result in the UIDs being processed twice..

Niftii
Added some initial support for a niftii file system / volume

Image Normalisation
Added some new pixel processing options to normalise the image data matrix to a specific dimension.
