Release Notes

pjk.jar 1.17.10
(Released 24/03/2022)

CMOVE Context ID
Modified the CMOVE response to put the correct context ID in the response in the case where more than one was proposed in the request. This deals with an issue where a system (Varian Aria) proposed both a CFIND (1st) and CMOVE (2nd) in the association. The CMOVE response simply used 0x01 as the context ID which in this case should have been 0x03 for the CMOVE SOP class in the association. Created a test class to replicate the requesting system behaviour to verify that 0x03 is used when CMOVE is the second SOP class proposed.
