## Release Notes

**pacsoology.jar 1.18.00**  
(Released 04/10/2021)

### **Workflow Management Service**

Work on a service to provide control over data import from external systems via DICOM and HL7 for management of imaging and reporting workflows.

### **User Preferences Encoding**

When sending user details back to the client when for a login. If the user had a complex signature as part of their config, it could cause the XML parsing to fail. The preferences are now encoded to prevent special characters causing a parsing issue.

### **Name Queries**

Better handling of specific DICOM queries that include the trailing ^.

### **Database Initialisation Optimisation**

When applying configuration changes, if a lot of databases are present in the network configuration, it could take a long time for the service to be initialised as it checked the schema of each database in the config. The schema check is now only applied after a service restart or for a database newly added to the configuration.
