Release Notes

pacsoology.jar 1.18.02

(Released 16/12/2021)

Workflow Service Update

Added in a wait in the CFIND and CMOVE requests in the event that a transient error status is returned by the connection attempt.

Changed the retrieve response to be complete on a complete status, not simply on the 0 remaining count.

Added in the option to record partially completed jobs.

Improve the transient wait logic to give preferential treatment to the CFIND.

Don't include studies with 0 images in patient history CFIND result for pre-processing jobs.

Optionally hide empty studies from the pre-processor history to prevent studies with zero images being selected for import.

Changed the max PDU when reading a CMOVE response to the max PDU on the association as when trying to read a CMOVE response from Aintry, the data length was 16K! This is the max PDU. Normally, the max PDU reading the response is set to 1024 because we don't expect a lot of data on the response.

Changed the logger name to lower case as it's not static.
